"Corundum Packing Masses for Lining of a Reactor for the Subchloride Process
of Distillation of Aluminum"

Tr. Vses. N-i. i Proyektn. In-ta. Alyumin., Magn. i Elektrodn. Prom-sti [Works
of All-Union Scientific Research and Planning Institute of the Aluminum, Magnesium
and Electrode Industry], 1970, No. 71, pp. 208-217. (Translated from Referativnyy
Zhurnal Metallurgiya, No. 5, 1971, Abstract No. 5 G170, by the authors).

Translation: A literature review is presented, and the characteristics of corundum
packing masses are given as functions of the addition of H_3PO_4 , H_3BO_3 , $Al(OH)_3$,
 TiO_2 , SiO_2 , $AlCl_3$, MgO . Compositions of these masses are developed with high
contents of Al_2O_3 . They have high density, and strength and low residual volume
changes following roasting. 2 figs; 3 tables; 11 biblio refs.

"Wave Type Converter made from Dielectric Wave Guides"

Tr. Mosk. energ. in-ta (Works of Moscow Power Engineering Institute), 1972, vyp. 100, pp 121-127 (from RZh-Radiotekhnika, No 7, Jul 72, Abstract No 7B135)

Translation: A study was made of the process of wave type conversion in a system of coupled single-wave and multiwave dielectric wave guides. It is noted that in order to simplify the analysis it is possible to use the fact that during operation of the converter with minimum losses in accordance with the practical requirements the waves in a single wave wave guide must be essentially connected only with one type of wave of the multiwave wave guide. Accordingly, the value of the linear coupling coefficient among the waves is defined experimentally. The measuring equipment and technique are described, and the results obtained are presented. There are 6 illustrations.

"Electrophoretic Precipitation of the Suspensions of Electroluminophores"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 46, No 4, Apr 73, pp 796-800

Abstract: The process of electrophoretic precipitation of electroluminophores from suspensions, and their behavior in electric field was studied in order to determine basic laws of the formation of electroluminescent panels by the electrophoretic method. To obtain desired ELP by the electrophoretic method, it is necessary to use a luminophore with uniform distribution of the activator's concentration among its particles, or the direction of the electric field and the concentration of the suspensions have to be selected so that they would fall in the range of the aggregation of particles. The brightness of the ELP obtained in this fashion should exceed the brightness of the panels obtained by the pulverization method.

"Stability of Complexes of Thorium and Uranium (IV) With Dicarboxylic Acid Anions"
Leningrad, Radiokhimiya, Vol 12, No 1, 1970, pp 175-178

Abstract: A previous article by the authors described methods for the synthesis of basic salts of dicarboxylic acids for cerium (IV), thorium and uranium (IV) and the solubility of these salts in 0.1 M solutions of (H, Na)ClO₄ at 25°C. Salts of succinic, glutaric, adipic and azelaic acids with the anion A_2Y^{2-} have the general formula $(\text{MOH})_{2n+1}\text{A}_2\text{Y}\text{H}_2\text{O}$. The present article makes an analysis of the solubility data with allowance for the formation of two complexes of the type M^{2+} and M_2^+ with stability constants β_1 and β_2 respectively. The values of β_1 and β_2 were calculated by searching for pairs of values of $\log \beta_1$ and $\log \beta_2$ such as would provide minimum variance of $\log SP$ of the salt in a given range, with the solubility product (SP) being 1/2

considered equal to $\frac{A^2}{M^3} \cdot \text{CH}^2$: rare-earth elements display
a strong decrease in the stability of complexes of higher di-
carboxylic acids as compared with oxalic acid. The same decrease
in stability is observed in the case of thorium and uranium (IV),
with the exception of azelates. In all cases (except the azo-
lates) $\log \beta_1$ is greater for U⁴⁺ than for thorium.

"Comparative Clinical and Electroencephalographic Examination of Patients with Mental Disorders Caused by Toxoplasmosis"

Kishinev, Zdravookhraneniye, No 4, 1971, pp 25-27

Abstract: EEG examination of 51 patients 11 to 55 years of age suffering from epilepsy and other mental disorders, congenital or acquired, due to toxoplasmosis revealed severe disturbances of bioelectrical activity consisting of diffuse and dysrhythmic shifts in the brain action potentials with disorganization of the rhythms. The alpha rhythm was either absent or irregular. Disorganization of the rhythms included hypersynchronous slow potentials (especially in the epileptics) in the form of irregular theta and delta waves. Against a background of diffuse impairment of bioelectrical activity, fairly pronounced bilaterally symmetrical electrical discharges were noted in leads from the central-frontal and parietotemporal regions of the cortex, an indication of change in the mesodiencephalic structures. Regular or paroxysmal waves, generally slow, in the temporal, parietal, and frontal

"Types of Dependence of Properties of Temperament on Properties of the Nervous System"

Moscow, Voprosy Psichologii, No 6, Nov/Dec 73, pp 39-50

Abstract: On the basis of experimental investigations and literature data the author identifies three types of dependences of properties of temperament on properties of the nervous system which he expresses mathematically in three ways. (1) He expresses them in intercorrelations, (2) in an integral linear dependence of the totality of temperamental indexes on the properties of the nervous system (discriminants), and (3) in an integral curvilinear dependence of the totality of the indexes of the properties of temperament on the properties of the nervous system (taxons). He finds these types to be in hierarchical relationship to one another. He also found that the psycho-physiological dependences of the properties of temperament on the properties of the nervous system and the psychological interdependences of the properties of temperament are homomorphous but not isomorphous.

THE RELATIONSHIP BETWEEN TYPE
AND INDIVIDUAL FEATURES OF TEMPERAMENT

V. S. MERLIN

Summary

A hypothesis was put forward that the regular relationship between psychological features of a certain temperament type can be expressed by means of a mathematical invariant model. This hypothesis was confirmed by experimental data obtained in two test groups: strong, balanced, mobile (temperament type I) and strong, balanced, inert (temperament type II).

A relatively stable integral index of lineary discriminator (in terms of O. M. Kalinin's formula) was calculated for each of these types in each subject. It follows from an invariant model that the temperament type is characterized not only by correlated psychological features but also by non — correlated ones. This hypothesis is borne out by data of another investigation of subjects with mobile and inert nervous processes.

"Total Weight of the Electrical Supply System of a Transport Facility"

Moscow, Energetika i Transport, No 2, 1972, pp 188-197

Abstract: A procedure for evaluating the total weight of the electrical supply system of a transport facility is presented, account not being taken of the increase in the design weight of the transport facility. The total weight of the electrical supply system is understood to mean the sum of the weight of the generating equipment and of the network and distributing devices, that part of the weight of the prime movers that depends upon the power takeoff for driving and cooling the generating equipment, and the weight of the fuel expended for generating the electric power, cooling the generating equipment, and transporting the specified weight and the supplementary weight of the electrical supply system during the time of movement of the transport facility. The proposed procedure is illustrated by an example. 3 figures. 2 tables. 8 references.

LASERS

EFFECT OF LASER BEAMS ON BIOLOGICAL OBJECTS

By V. P. RUMYANTSEV, V. V. PAVLOVSKII, N. V. SOKOLOV
Institute of Biophysics, USSR Academy of Sciences, Kosygin Street,
Bldg. 1, Moscow 127994, USSR
Received at Wash. D.C., August 20, 1971, Summarized

The present work investigates the effect of focused and unfocused pulsed ruby-in-glass laser beams operating at 10.6 μm on plant and numbered tissue in an attempt to explain the nature of damage to a biological structure.

Theoretical calculations are made of the transmission coefficient of different laser radiation modes through living tissue at various intensities of the temperature generated in the tissue at a given irradiation energy. Preliminary investigations confirmed a theoretical computation of the temperature coefficients.

From microangiographic investigations have shown that when living tissue is subjected to laser radiation, destruction and the loss of cellular structures. Their total or partial destruction is attributed to the thermocochlear effect of the laser beam that leads to great temperature and, subsequently, pressure drops which could be the main cause of the damage to the tissue and death of cells.

Investigation of the concentration of free radicals in irradiated tissue subjected to an unfocused laser beam has shown that their energy densities do not deviate the physical and chemical processes of the tissue that take place in normal processes.

The results of the investigation described above facilitate a deeper understanding of the effects of light on the activity and properties of living matter. Since to date there has been no unified picture of such effects on bioblocks encompassing the entire frequency spectrum from the far infrared to the ultraviolet. From the scientific interest involved in an explanation of the mechanism of action of powerful light flux on structures, the investigation has important practical applications in space biology and medicine, especially related to the problem of ensuring astronaut protection against light effects.

The introduction of lasers into the arsenal of scientific laboratories has made it possible to begin investigations dealing with the effect of powerful light fluxes on biological objects. In this matter, the development of specific technical conditions for laser operation

MERTSAKOVA, L.V.

HISTOLOGIC HISTOGENETIC INVESTIGATION OF THE MAMMOGRAPHIC TUMOR UNDER
THE EFFECT OF LASER RADIATION

[Article by L. A. Pruzyan, V. V. Turavina, G. V. Ponomareva,
Mertsakova, and V. N. Lomantsev. Translated from Radiotekhnika i
Radiofizika, Series Biomeditsina, February, 1979, Vol. 24, No. 2, p. 460]

The article examines the effect of laser radiation on the ultrastructure of the Harding-Passey tubularia. It has been established that irreversible changes occurred in the zones not directly irradiated. The most damaged organelles of a Harding-Passey tubularia cell were the mitochondria, whereas the nuclear structures, the nucleoli and the nucleoplasm, as well as the virus-like formations, revealed no morphological changes. Strong induction was noted in the cell cytoplasm. A diminution of temperature changes in the adjacent tissue according to the distance from the center of the laser lesion is presented. The cause of the effects which occurred in the mammosa cell under the action of the laser are explained as the effect of the thermal-mechanical factor.

The creation of lasers has permitted biophysicists to begin investigations connected with the effect of nonionizing luminous fluxes on biological objects. The literature contains information about the histological changes of malignant melanomas (melanomas) after irradiation by a laser (Pruzyan et al., 1978) and also on the free-radical content in an irradiated malignant melanoma (Pruzyan et al., 1978). Therefore, it is of interest to examine affections in a tumor on the ultrastructural level.

In the present work a Harding-Passey melanoma was subjected to laser irradiation in order to investigate the electron

"Electron Microscope Study of Harding-Passy Melanoma Under the Influence of
Lasers"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 3, May/Jun
70, pp 463-467

Abstract: The effect of laser irradiation on the ultrastructure of Harding-Passy melanoma was studied. It was found that the zones which had not been irradiated directly contained irreversible changes. Mitochondria were most damaged, and their organization disrupted, whereas the myelin structures, nucleus and nucleoli, and virus-like formations showed no morphological changes. A strong vacuolization in the cytoplasm of the cells was noted. Temperature changes in melanoma tissue are proportional to the distance from the center of laser action. All changes in melanoma tissues under the action of lasers are explained on the basis of the thermomechanical effect.

"Formation of a Semi-Liquefied Layer During the Combustion of Condensed Systems With Solid Non-agglomerating Admixtures in a Field of Mass Forces"

Novosibirsk, Fizika Goreniya i Vzryva, Vol 9, No 4, Jul-Aug 73, pp 496-501

Abstract: The authors conduct an experimental study to explain the regularities associated with the pseudo-liquefied layer and its effect on combustion. This study is based on an earlier work by V. I. Yukhvid et al., Fizika Goreniya i Vzryva, Vol 9, No 2, 1973, where the authors observed that the rate of combustion of ammonium perchlorate with a refractory metal admixture (titanium) increases as the overload is increased where the overload is set up by centrifugal acceleration. On the basis of the results of that study, a mechanism is proposed for the combustion of the composition under the effect of mass forces. In the current study, inert refractory particles were used in the form of aluminum oxide. The test was conducted on a centrifuge. The combustion rate was measured by photoregistration. The overload vector in all of the tests was directed along the normal to the combustion surface, in the front propagation direction. The specimens were in the form of cylindrical tablets 0.8 cm in diameter and 2.4-2.5 cm high. These had been pressed to the point of maximal density. The results show that the motion of the com-

496-501

bustion front is uniform and that the effect of mass forces is complex in nature.
A fall in the rate of combustion follows the combustion rate increase segment.
These results can be explained by the properties of the pseudo-liquefied layer
and the effect that they have on the combustion process.

"Experimental Realization of a Hydrodynamic Thermal Explosion"

Moscow, Doklady Akademii Nauk SSSR, Vol. 210, No 1, May 1973, pp 52-54

Abstract: In studying the problem of nonisothermal Poiseuille flow in a circular pipe with a given pressure gradient, it has been discovered that there is no stationary solution at certain values of the parameters. The phenomenon of hydrodynamic thermal explosion has been predicted on the basis of this theoretical research. It has also been theoretically demonstrated that this effect could arise in Couette flow with time-constant shear stress on a moving boundary. However, up until now this phenomenon had not been experimentally confirmed. In this paper the authors describe the successful realization of the conditions which produce this effect and give quantitative verification of the theory. The research was done on a rotation viscometer with pneumatic drive ensuring constant torque. The basic distinguishing feature of the installation is the design of the outer

cylinder (see figure) which is made in the form of a Dewar flask with outer cylinder (see figure) which is made in the form of a Dewar flask with outer thermostatically controlled jacket 4. The inner rotating cylinder 1 is a hollow steel cup connected by ebonite rod 5 to the rotor of a small gas turbine. The diameter of the outer cylinder $2R_1 = 4.84$ cm, the diameter of the inner cylinder $2R_0 = 3.9$ cm, and the length of the inner cylinder $l = 7.2$ cm. The gap 2 is filled with the liquid to be studied to a level somewhat higher than the top of the inner cylinder. The rpm n of the inner cylinder was measured by a perforated disc on the shaft and a photocell with output to a frequency meter. Temperature differential was measured by a thermocouple with one junction on the inside wall of the Dewar flask and the other inside the thermostatically controlled jacket. The resultant curves for temperature differential and rotational velocity as functions of time demonstrate the effect of hydrodynamic thermal explosion.

"Thermal Explosion in Liquid Reacting Systems with Thermal Convection"

Fizika Goreniya i Vzryva, No 1, Mar 71, pp 68-76.

ABSTRACT: This work presents a study of the influence of free convection in a reacting medium on the conditions of development of thermal explosion. The main task of the investigation is the establishment of a relationship between the limit of the thermal explosion and quantities characterizing natural convection. Analysis of experimental results produced on specially selected models is used to establish the form of the function $f(R_e)$ for the planar and cylindrical cases, and certain problems of the mechanism of thermal explosion in the presence of convection are discussed.

"Theory of Degeneration of Thermal Explosion"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 45, No 2, Feb 71, pp 379-382

Abstract: Experimental data are reported in support of the sequence proposed by the authors for the degeneration of thermal explosion. The kinetics and auto-thermal explosion were studied of two model reactions of tetryl; an auto-catalytic reaction and a first-order reaction. Degeneration characteristics were determined from the experimental data for the reactions tetryl-picric acid and tetryl-limestone. Experimentally obtained values agreed well with the theoretically calculated ones.

"Thermal Explosion in the Liquid Phase in the Presence of Natural Convection"

Moscow, Doklady Akademii Nauk SSSR, Vol 194, No 1, Sep-Oct 70, pp 136-
139

Abstract: The article analyzes experimental data obtained on specially selected models to establish the form of the function $f(Ra)$ for the two-dimensional case. The models chosen were mixtures of hexamethylene diisocyanate with various alcohols in 1:2 ratios. Questions on the mechanism of a thermal explosion in the presence of convection are discussed, viz. the effective coefficient of internal heat transfer, the influence of the rate of internal heat emission, the temperature distribution in the reaction zone.

III. SHOCK WAVES IN LIQUIDS

Aristarkhan, E. I., V. K. Bobylev, and
A. V. Dubrovsk. Collapse of an elliptic
cavity and explosive initiation in a
liquid layer under shock effect. ZhFMTF,
no. 5, 1971; 78-85.

Analytical and experimental results are given on the effect of shock excitation of a combustible liquid volume. Criteria are developed for the threshold conditions under which a nominally spherical fluid volume shifts to an ellipsoidal form, and on further compression develops into a cumulative jet; in the limit this results in detonation from adiabatic heating of gas evolved in the volume. Test data on shock generation of jets in liquid nitroglycerine are included, and show qualitative agreement with theoretical results.

Shestopal', E. A., K. B. Pribrykova, and
A. G. Merzhanov. A numerical solution
to the problem of a thermal explosion with
free convection taken into account. FGIV,
no. 2, 1971, 167-178.

The authors cite previous works in which the effect of free convection on a gas explosion process is expressed in terms of the Rayleigh (Ra) and Frank-Kamenetskii (δ) criteria. The analysis is extended here to the case of liquid fuel combustion, and is presented as a supplement to earlier experimental work by Merzhanov and Shestopal' (FGIV, no. 1, 1971) in which an empirical correlation between Ra and δ was obtained. The model used assumes an ideal stationary fluid in a uniform semi-infinite vessel; gas evolution is neglected. The results are shown graphically, indicating the conditions under which convection will or will not affect the detonation process.

Moscow, "Nauka", 1972, pp 227-233 (from RZh-Mekhanika, No 3, Mar 73, Abstract
No 3B938)

Translation: The gas-phase combustion of a drop of liquid fuel close to critical conditions is considered on the basis of the inertia of the gas medium, and the validity of substituting the equations of multicomponent diffusion for the equations of independent diffusion ordinarily used is also analyzed. A computer solution to the problem is given. It is shown that it is impossible to neglect the inertia of the gas medium in problems concerning the combustion of a droplet and also that the drop is completely evaporated under critical conditions at the moment of combustion, and that the combustion picture at small distances from the limit considerably depend on the magnitude of the total pressure in the gas phase (or in the evaporation intensity which is defined as the evaporation intensity in the absence of chemical reaction).

"Conditions for the Origin of Thermal Explosion in the Course of a Chain-Branching Reaction"

Novosibirsk, Fizika goreniya i vzryva, No 2, 1973, pp 163-169

Abstract: Using the example of one of the kinetic systems of heat explosions in complex chemical reactions, the authors consider the critical conditions of the explosion in the course of chain-branching reactions with uniform breaks of the chain. The effect of spontaneous heating on the process with no thermal explosion is also examined. The temperature gradients and the concentrations of the active centers of the chains in the reaction space are not taken into account; the part played by these gradients and the errors involved in averaging the temperature field are to be dealt with in another paper. This theoretical analysis begins with a system of six equations representing the reaction mechanism; from these is obtained a system of kinetic differential equations which was solved, together with the equation of thermal equilibrium, on an electronic computer.

"Peculiarities of High-Temperature Dissociation of Ammonium Perchlorate and Heterogeneous Systems Derived from it"

Novosibirsk, Fizika gorenija i vzryva, No 2, 1973, pp 185-191

Abstract: The purpose of this theoretical article is to analyze the effect of dissociative sublimation on the macrokinetic high-temperature decomposition of ammonium perchlorite (APC) and model mixtures derived from it. Dissociative sublimation is the distinctive peculiarity of APC decomposition. The method of the authors is to use the physical representations of the "volume vaporization" effect developed in an earlier article (A. G. Merzhanov, et al, FGV, 4, 4, 1968) in the decomposition process of volatile explosive materials in the condensed phase. Although APC does not melt at temperatures below 550° C, the general run of its decomposition is similar to that of secondary explosive materials. The present article examines the effect of pressure on APC high-temperature decomposition and the decomposition of APC-polymer mixtures. Tables are given for experimentally determined values of the thermal effects of the decomposition, and for the

"Combustion Mechanism of Condensed Systems With Solid Admixtures
in a Mass Force Field"

Novosibirsk, Fizika goreniya i vzryva, No 2, 1973, pp 235-240

Abstract: This paper presents the results of experiments to study the rarely examined case of the combustion of systems with non-agglomerating admixtures. The experiments were conducted in a mass force field on compositions of ammonium perchlorate and titanium. The assumption of non-agglomeration is based on the fact that the melting point of Ti is, at 1700°, much higher than that of the perchlorate, at 1100° C. A diagram of the centrifuge in which the experiments were conducted is given together with a description of the experimental method. The rate of combustion was measured by film photography. The reader is referred to an earlier paper (B. B. Serkov, et al, FGV, 1968, 4, 4) for a more detailed description of the apparatus and methodology. The combustion rate was measured as a function of accelerations in the interval of 36 to 1200 g at room temperature. A model of the combustion process is devised to explain the experimental results.

"Formation of an Unsteady Diffusive Combustion Front During the Ignition of a Drop of Liquid Fuel"

Odessa, 11-ya Vses. Konf. po Vopr. Ispareniya, Goreniya i Gaz. Minamiki Dispersn. Sistem, 1972--Sbornik(11th All-Union Conference on Problems of the Evaporation, Combustion, and Gas Dynamics of Dispersed Systems, 1972--Collection of Articles), 1972, pp 42-43 (from Referativnyy Zhurnal--Aviatsionnyye i Raketnyye Dvigateli, No 1, 1973, Abstract No 1.34.11; Resume)

Translation: A theoretical investigation is conducted of the process of the formation of an unsteady diffusive combustion front during the ignition of a quiescent drop of evaporating liquid fuel in an inorganic gaseous atmosphere containing an oxidant. The investigation was conducted for a thermal ignition mechanism and transition from ignition to unsteady diffusive combustion. During the analysis, account was taken of the unsteadiness of the process of heat and mass exchange in the gas medium. It was established that on the basis of the nature of the process taking place, the transition from ignition to unsteady diffusive combustion may be represented as an aggregate of the successive stages: formation of an unsteady diffusive combustion front -- unsteady diffusive combustion.

"Multizone Burning of Condensed Systems"

Moscow, Zhurnal Prikladnoy Mekhaniki i Tekhnicheskoy Fiziki, No 6, Nov/Dec
72, pp 99-105

Abstract: In the general case, combustion of condensed systems takes place in stages, and the combustion front is multizonal. Investigation of a two-zone model has shown that one of the zones predominates in multizone burning. The velocity of the front is equal to that of the predominant zone, but when there is a change in the parameters of the system, there may be a switch in the predominant role from one zone to another, as well as merging and splitting of zones. A generalization of the two-zone model with possibilities for transition to analysis of a complex multizonal front is considered, and it is shown that for a front with two reactions (in the condensed phase and in the gas) and dispersion, only three variants of the possible types of relations are found for the burning rate as a function of the depth of dispersion.

"Mechanism and Regularities of Ignition of Condensed Systems by a Disperse Flow"

Novosibirsk, Fizika Goreniya i Vzryva, No 3, 1971, pp 319-332

Abstract: This work is dedicated to investigation of the process of ignition of condensed substances under complex heat exchange conditions - ignition of the substance by a disperse flow (gas-solid particles). New experimental data are used and quantitative processing of the regularities established is performed on the basis of the simplest model of solid phase ignition. The process of ignition of nitrocellulose, polyvinyl nitrate and other explosives by a disperse stream is studied. The characteristics of the stream and softening point of the substances are found to influence the nature of the process significantly. An approximate theoretical model of the process is suggested. The results of numerical analysis based on this model agree well with experimental data.

"The Theory of Equilibrium of Drop Vaporization"

Moscow, Zhurnal Fizicheskoy Khimii, Vol 44, No 3, Mar 70, pp 647-652

Abstract: General transfer equations in a two-component system are used as the basis in deriving a system of equations which describes the equilibrium of vaporization of a drop when the process takes place at high intensity. The characteristics of vaporization are calculated with regard to Stefan flux, the temperature dependence of the transfer coefficients, the overall pressure differential of the medium due to vaporization, and the difference between the molecular weight of the components of the medium. Expressions are derived for the rate of vaporization, the drop surface temperature, and dimensionless transfer numbers. Generalizing criteria are found which characterize the part played by Stefan flux. Corrections for the rate of vaporization are found which account for the temperature dependence of the transfer coefficients. The pressure differential in the gas is calculated. Vaporization of the drop in an atmosphere of the same vapor is considered. Calculations for water and ethyl alcohol by the proposed formulas show satisfactory agreement with the experimental data of various authors.

"Critical Conditions of Thermal Explosion in the Presence of Chemical and Mechanical Thermal Sources"

Novosibirsk, Fizika Gorenija i Vzryva, vol 7, No 4, December 1971,
pp 502-510

Abstract: On the basis of a simplified quasi-stationary approach to the solution of the thermodynamic problems proposed by the authors named above in an earlier article (Dokl. AN SSSR, 1971, 198, p 6), they derive analytically the conditions for thermal explosion for Couette flow in a viscous, reactive liquid. The explosion may be caused by chemical or mechanical sources of heat such as internal friction, a subject which has not received sufficient attention in the past. Cases of the viscosity as a different function of the temperature and as a different method for specifying the boundary conditions at the mobile limit are considered. The critical conditions for specified tangential tension and specified flow velocities are derived, and an example for computing the critical parameters is given.

"On the Problem of Designing a Diffusion Chamber with Time-Variable Temperature Conditions at the Wall and Supersaturation with Respect to Volume"

Minsk, Inzhenerno-fizicheskiy zhurnal, Vol 19, No 6, Dec 70, pp 983-990

Abstract: The authors investigate a simple heat transfer scheme which can be used to determine time-periodic temperature conditions at the wall of a diffusion chamber. An equation is derived and solved which describes the change in wall temperature with time. Analysis of the solution shows the possibility of three sets of conditions at the wall: $\omega \gg h/H\rho C$, $\omega \ll h/H\rho C$,

... $\omega = 2\pi/T$, where T is the period of wall temperature variation, H is wall thickness, ρ is the density of the wall material, C is the specific heat of the wall material, and h is the heat-exchange coefficient. These sets of conditions present various experimental possibilities. A detailed analysis of all three sets of conditions is given, the optimum values of h_0 and γ_0 being determined for each of them, where γ is the product of duration and repetition frequency for the temperature cycle. Expressions are also examined

1/2

USSR

"Potentials Evoked by Stimulation of the Red Nucleus in the Case of Direct and Feedback Conditioned Associations"

Moscow, Zhurnal Vysshey Nervnoy Deyatel'nosti, Vol 23, No 3, May/Jun 73,
pp 632-635

Abstract: Experiments were conducted with cats to find how a feedback conditioned association is expressed electrographically. An electrode was implanted in the cats' red nucleus, and a conditioned food-getting response was developed in association with a feeder. It was found that potentials registered during a strong conditioned reflex had no extra components. However, tests for the feedback association, accomplished by electrical stimulation of the red nucleus in the absence of the feeder, evoked potentials which registered late, negative, low-amplitude components. Their latent phase fluctuated from 30-60 milliseconds in different cats. The presence of these components indicates the conditioned nature of the feedback association.

Sh.)

Translation: A preliminary study of the photostimulated luminescence allowed the establishment of the spectral characteristics of a series of basic capture centers in CaWO_4 and explained the relationship between the excited absorption bands and peaks of thermal-stimulated luminescence. This permitted the expectation that further study of the photostimulated luminescence in complexes by other methods would give useful information on the nature of the capture centers, the mechanism of the recombination processes, and the role of these factors in the luminescence of this interesting and industrially important class of luminescent compounds of the type CaWO_4 .

"Experiment in Hologram Reproduction Using Computers"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, No 2, 1972, pp 419-420

Abstract: The authors, members of IPPI (Institute of Information Transmission Problems) of the USSR Academy of Sciences, conducted an experiment on the Minsk-22 digital computer for the purpose of reproducing the image of an object from its hologram developed from a Fourier system. The results of this experiment, described as the first step in the use of a computer for this purpose, are given in the present paper. A hologram made in the A. F. Ioffe Physico-technical Institute was used in the experiment for the purpose of investigating the possibility of transmitting holograms over a phototelegraphic channel. The basic stages of the experiment are outlined, and three photographs showing an original hologram, its reproduction through the use of the computer, and its reproduction by laser are obtained. The authors note that the whole reproduction procedure using the computer takes about six hours of machine time on the Minsk-22.

"Pills? No, Psychotherapy!"

Minsk, Znamya Yunosti, 16 Feb 73, p 4

Abstract: Two techniques of psychotherapy are recommended for many disorders in which a psychogenic component may be present: hypnosis and autogenic training. Following a brief description of a routine session of hypnosis induced by a physician, several examples are given of individuals suffering from bronchial asthma, inflammation of the diencephalon, and stammering who responded to hypnotic suggestion after being unsuccessfully treated by drugs and other methods. Autogenic training or autosuggestion may be used in addition to hypnosis or in the absence of a psychotherapist to treat neuroses and some somatic diseases.

"Quinindines. V. Chlorination of 2,3-Polymethylenequinolines With Phosphorus Pentachloride"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 1, Jan 71, pp 91-95

Abstract: When reacted with excess PCl_5 in phosphorus oxychloride β -quinindane yield 1,1,2,3,3-pentachloro- β -quinindane; 1,2,3,4-tetrahydroacridine yields 3,4-4-trichloro-1,2,3,4-tetrahydroacridine; β -quinindanone-9 gives 3,3,9-trichloro- β -quinindane, and 1,2,3,4-tetrahydroacridone-9 gives 4,4,9-3,3,9-trichloro-1,2,3,4-tetrahydroacridine. When 1,2,3,4-tetrahydroacridine-9-Otrichloro-1,2,3,4-tetrahydroacridine. When 1,2,3,4-tetrahydroacridine-9-carboxylic acid is chlorinated under analogous conditions, first an acyl chloride is formed which then converts to 4,4-dichloro-1,2,3,4-tetrahydroacridine-9-carboxylic acid. IR, UV spectroscopical data are reported, and PMR spectra are analyzed in detail.

ON A METHOD FOR STUDYING THE HYDRO-URETIC COMPONENT
OF THE OSMOREGULATION SYSTEM

A. K. Merson and L. V. Khorunzhaya

Clinic for Internal Diseases, State Medical Institute, Donetsk

Effect of intravenous administration of ethyl alcohol on the renal function was studied in practically healthy people under water deprivation. Minority doses (less than 0.5 ml 96% alcohol per 1 kg of body weight) proved to be ineffective. Greater doses (0.6—0.8 ml/kg) entailed a complete central blockade of the antidiuretic hormone (ADH) followed by a marked water diuresis approximately at the same time as after peroral water load. The described method proved useful for revealing the role of inappropriate ADH secretion in impaired hydrouresis. Thus, in patients with severe congestive heart failure and no hyponatremia, the excessive drinking of water and intravenous alcohol administration failed to cause hydrouresis, which gave ground to reject any connection between impaired hydrouresis and ADH hypersecretion in these patients.

ELECTRON MICROSCOPIC STUDIES OF ANTIGENS
LOCALIZATION IN F. TULARENSIS WITH THE AID
OF FERRITIN-LABELED ANTIBODIES

Kats, L. N.; Mescheryakova, I. S.; Oglyevetskaya, M. M.

A study was made of localization of Vi- and O-antigenic complexes in the virulent (S), vaccine (SR) and avirulent (R) strains of *F. tularensis* with the aid of ferritin-labeled antibodies. Vi- and O- γ -globulins were marked with ferritin by Singer's method (1959). Vi- and O- γ -globulins were prepared from antisera obtained in immunization of rabbits with the S- and R-cultures of *F. tularensis*, respectively. Electron microscopic studies were carried out on intact microbial cells. Considerable amount of Vi-antigen of the virulent strain proved to localize along the whole thickness of the capsule-like coat, and O-antigen — on its surface. In avirulent strain O-antigen also localized along the whole capsule-like coat. The problem on localization of ferritin-labeled antibodies in other bacteria, and also on the structures of bacterial cells serving as the antigen-carriers is discussed.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS ANALYZE DATA OF 175 RADICAL OPERATIONS ON THE STOMACH (OF THEM 28 GASTRECTOMIES) PERFORMED FOR CANCER (108), PEPTIC ULCER (49) AND BENIGN TUMORS (12). CONCOMITANT DISEASES OF INTERNAL ORGANS WERE NOTED IN 101 PATIENTS. IN 54 PATIENTS IN THE POSTOPERATIVE PERIOD THERE WERE OBSERVED FUNCTIONAL DISORDERS OF INTERNAL ORGANS AND COMPLICATIONS, WHICH IN 7 CASES WERE THE CAUSE OF A LETHAL OUTCOME (4. PLUS OR MINUS 1.5PERCENT): 5 PATIENTS DIED FROM PERITONITIS DUE TO FAILURE OF ANASTOMOTIC SUTURES, 2 FROM EMBOLISM OF THE PULMONARY ARTERY. BESIDES, IN 8.7PERCENT OF PATIENTS THERE WERE SURGICAL COMPLICATIONS, IN 8.7PERCENT, CARDIOVASCULAR, IN 5.4PERCENT, PULMONARY, IN 3PERCENT, THROMBOEMBOLIC. THE AUTHORS EMPHASIZE THAT CONSTANT CLINICO FUNCTIONAL OBSERVATION OVER PATIENTS IN A SPECIALIZED POSTOPERATIVE DEPARTMENT ENSURES THE TIMELY DETECTION AND FUNCTIONAL DISORDERS OF INTERNAL ORGANS IN OPERATED PATIENTS AND THE REQUIRED CORRECTION OF THESE DISTURBANCES BEFORE THE DEVELOPMENT OF COMPLICATIONS.

"Processing of Large Files of Statistical Information on the BESM-3M Computer"

Preobrazovaniye i Obrabotka Inform. [Conversion and Processing of Information -- Collection of Works], Moscow University Press, 1972, p 4-9 (Translated from Referativnyy Zhurnal Kibernetika, No 4, 1973, Abstract No 4V6S1, by V. Mikheyev).

Translation: Some methods of processing of large files of statistical information on the BESM-3M computer during solution of a number of problems are described. Among the problems involved are: 1) the problem of classification of multidimensional objects with dimensionality of vectors on the order of several dozens; 2) creation of a constantly growing file of medical case histories (the number of possible coordinates may reach into the hundreds) for subsequent statistical processing; 3) processing of multidimensional random processes of great length, when the product of dimensionality times length reaches the order of hundreds of thousands. The methods developed as applicable to the BESM-3M digital computer, with its relatively small main memory and comparatively slow input, allow the input time and required memory volume to be

Surgery**USSR**MESHALKIN, Ye.**"The Future of Cardiac Surgery"**

Baku, Bakinskiy Robochiy, 24 Feb 71, p 4

Abstract: Prof Yevgeniy Meshalkin, a prominent Soviet cardiac surgeon, Lenin Prize-Winner, and Honored Scientist of the RSFSR was one of the first surgeons who operated on the human heart. Today, he is head of the famous Institute of Cardiovascular Pathology in Novosibirsk. In his opinion, heart transplantation must wait until the problem of tissue incompatibility is resolved. In the meantime, the $\frac{1}{3}$ of the world population who suffer from various heart conditions must be helped with corrective surgery and treatment preventing complications. To achieve results equivalent to the progress made in combating malaria or poliomyelitis, a state system of combating heart diseases must be established. One aspect of this project -- the state system of cardiosurgical aid -- is off to a good start in the Soviet Union. During the last 5 years, the Siberian Institute of Cardiovascular Pathology has participated in establishing seven more cardiology centers in the USSR. However, a great number of well trained cardiologists are needed, intensive research

1/2

USSR

MESHALKIN, Ye., Bakinskiy Robochiy, 24 Feb 71, p 4

must supply answers to many questions, old techniques must be improved and new ones developed to facilitate surgery, diagnosis, and preventive treatment. It is most important that organization be streamlined so that all resources are utilized as soon as they become available. The final goal is to offer free cardiovascular service to every person who needs it.

"Resuscitation of the Organism After Prolonged Clinical Death by Means of an
Artificial Circulation Apparatus in Association With Hemodilution and Hypo-
thermia"

Kiev, Vrachebnoye Delo, No 4, 1973, pp 73-77

Abstract: To refine the method, experiments were conducted on 72 anesthetized dogs in which uni- or bilateral thoracotomy was performed and clinical death (disappearance of EEG waves) caused by discontinuation of artificial respiration and induction of cardiac arrest. Eight to 18 min after clinical death, resuscitation was begun with blood flow maintained by a pump either through the coronary and carotid arteries or through the whole body at rates of 60-120 ml/kg/min, under normothermia or hypothermia, with utilization of heparinized donor blood or a plasma expander to achieve hemodilution. The total perfusion time was 40-60 min. Resuscitation was considered successful if normal EEG, effective heart activity, spontaneous respiration, renal function, motor activity, and unconditioned and some conditioned reflexes were restored. The 1/2

USSR

MESHALKIN, Ye. N., et al., Vrachebnaya Delo, No 4, 1973, pp 73-77

optimal conditions -- whole-body perfusion at a rate of 80-100 ml/kg/min, with blood diluted to about 6-8 g% Hb, and a hypothermia of 28-30°C achieved in 5-8 min -- yielded a recovery rate of 80%. This method was subsequently applied on 19 patients during cardiac surgery complicated by cardiac arrest and failure of all other therapeutic measures. Five patients were successfully resuscitated; they recovered and were eventually discharged from the hospital in satisfactory condition. The case history of a 12-year old cardiac surgery patient is given.

"Peroral Immunization of Humans with Typhoid Vaccines in a Strictly Controlled Experiment"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 10, 1972,
pp 71-77

Abstract: Following a successful trial of enteral immunization of children with heated typhoid vaccine, larger doses of the same vaccine - heated and chemical - contained in sugar-coated tablets were given in a double-blind test to 1225 children age 3 to 15 and 274 adults in 2 equal doses 15 to 30 days apart. The reactions to the vaccine were mild and they generally occurred after ingestion of the first tablet: in 13.6% and 9.31% those who took the heated and chemical vaccines, respectively (in 5.88% of those who received placebo). Both vaccines produced high antibody titers against the O, Vi, and H antigens in the sera of the children as well as the adults. The authors recommend a major epidemiological trial of the vaccines in regions with a high incidence of typhoid.

"A Hodoscopic Installation for Investigation of the Elastic Scattering of
High-Energy Particles"

Moscow, Pribory i Tekhnika Eksperimenta, No 3, May/Jun 73, pp 49-53

Abstract: A description is given of a hodoscopic installation, developed at the Institute of High-Energy Physics, for investigation of the elastic scattering of high-energy particles within the pulse range of 30-60 gigaelectron volts/sec. The range of dispersion angles covered by the installation is 0-29 millirads with an angular resolution of ± 0.17 millirad. The total solid angle is 39 microsteres. The pulse is determined to within $\pm 0.22\%$. The resolving time is 35 nanosec. The dead time is 50 microsec. The pulse pass band of the spectrometer is 8%. The statistics-setup is up to 10^6 per hour. The installation is electrically coupled to a "Minsk-22" computer, which stores and processes the information during the experiment.

"Low-Alloy 12% Chrome Steel With Nitrogen"

Moscow, Metallovedeniye i Termicheskaya obrabotka Metallov,
No 8, 1970, pp 12-14

Abstract: A study was made to find a steel with a higher creep limit than the refractory steels 1Kh12N2VMF (MI961) and 11-736. The 12%-chromium steel investigated had no nickel but did contain nitrogen, and had a total of 1-1.5% of carbide-forming elements other than the chromium. The carbon content of the investigated samples was between 0.14 and 0.23%. A table gives chemical compositions 10 samples of the 12%-chromium steel and for the 1Kh12N2VMF steel. A second table and a curve show the effect of tempering on the steel samples. X-ray analysis of the specimens after full thermal processing and after creep tests performed for 500 hours at 600° C showed that the toughening phase was M₂₃C₆ and M(CN). The steel samples were also tested for mechanical characteristics and corrosion in distilled water, under local and tropical atmospheric conditions, and showed satisfactory immunity to corrosion for five to six months. If the steel is to be used in cast form, the nitrogen must be replaced by nickel.

Translation: A study was made of the problem of the best distribution of limited manpower for enterprises with a multirequest plan of development, and the method of solving this problem based on the multinetwork models is discussed. Each operation of the PERT charts is executed by a group of resources of different type where the composition of each group is put together during the process of compiling the calendar plan for the operation of the enterprise. For the operations entering into the separate sections of the PERT charts in a special form, the problem of determining the optimal intensity of their execution is solved using the methods of linear programming. For the remaining operations of the PERT charts a heuristic algorithm of resource distribution is proposed.

SURFACE AIR IN THE VICINITY OF MOSCOW FOR THE PERIOD FROM 1962 TO 1967
ARE PRESENTED. MONTHLY FALLOUT LEVELS OF PRIME141 GE, PRIME144 GE,
PRIME137 CS, PRIME54 MN, PRIME95 NB PLUS PRIME95 ZR, PRIME103 RU, AND
PRIME106 RH PLUS PRIME106 RU ARE TABULATED AND PLOTTED.
FACILITY: GOSUDARSTVENNYI KOMITET PO ISPOL'ZOVANIYU ATOMNOI ENERGII
SSSR, MOSCOW.

"A Device for Taking Microwave Holograms and Making the Restored Image Visible"

USSR Author's Certificate No 275257, filed 18 Mar 69, published 13 Oct 70
(from RZh-Radiotekhnika, No 5, May 71, Abstract No 5D511 P)

Translation: This Author's Certificate introduces a device for taking microwave holograms and making the restored image visible. The device contains a microwave oscillator, an antenna which exposes the space to be photographed, a reference wave antenna, a band filter, a mixer and a reference oscillator. As a distinguishing feature of the patent, a real-time image is obtained without using coherent light sources by employing a multichannel receiver with double frequency conversion for receiving signals in the plane of the hologram. The second mixers of this receiver are connected to the reference oscillator through a system of phase shifters and a frequency multiplier, while the receiver outputs are connected to incoherent light sources with controllable brightness through series-connected ultrasonic converters and ultrasonic receivers. The illuminated cross section of the photographed space is selected by changing the frequency of the reference oscillator.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. DESCRIPTION OF MICROWAVE
HOLOGRAPHY WITH AN ARTIFICIALLY FORMED REFERENCE WAVE AND A RECEIVER
MULTIPLIER APPARATUS THAT MAKES IT POSSIBLE TO RECORD A HOLOGRAM AT
REFERENCE WAVE ANGLES OF INCIDENCE MUCH SMALLER THAN THOSE IN OPTICAL
SYSTEMS. HOLOGRAMS WERE RECORDED AT A FREQUENCY OF 9.37 GHZ, AND LASER
RECONSTRUCTED IMAGES ARE GIVEN FOR ILLUSTRATION. THE PROPOSED METHOD
MAKES IT POSSIBLE TO BRING THE OBJECT CLOSER TO THE HOLOGRAM AND THUS
IMPROVE THE LINEAR RESOLUTION IN THE IMAGE.
